

The table displays *E.coli* levels at various locations on the Guadalupe River . *E.coli* levels are recorded as number of colonies of bacteria per 100 milliliters of water for a single grab sample. The Texas Commission on Environmental Quality has set the *E. coli* standard for contact recreation (swimmer fully submersed in water) at 394 colonies of bacteria per 100 milliliters of water. Levels that exceed this standard are displayed in red. If levels exceed this standard, the risk of contracting waterborne illnesses increases (30 TAC §307.7).

TNTC = too numerous to count

* Samples collected on 7/2/07 followed several days of heavy rainfall. *E. coli* levels are usually elevated after heavy rainfall and flooding events. Please always use caution when entering the river after flooding.
